

Time for Accuracy

People say that 'time is money'. Have you ever thought how much money your organisation is losing because of mistakes? Mistakes inevitably lead to wasted time. In fact where you have people processing information – things like customer details, personnel information, sales, payments, policy numbers or account references for example – typical error rates mean you're wasting around 20% of the working week simply making, finding and correcting mistakes. Even apparently small initial error rates result in a huge amount of wasted time because it takes so long to track down mistakes and put things right.

So accuracy is worth its weight in gold. Or to put it another way, a 'gram' of accuracy is worth a 'kilo' of productivity! Training people to read, check and transfer information accurately means your operations become more efficient and productive.

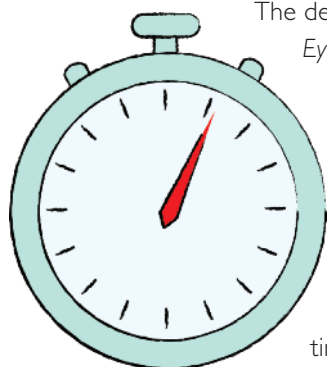

A 'gram' of accuracy is worth a 'kilo' of productivity!

And here's another thought...

Most people believe that to become more accurate you have to work more slowly. In fact, you need to be working at the 'optimum speed for accuracy', which means working faster than you might think. If you work slowly your brain has spare capacity to be distracted by things other than your task.

But if you are focused 100% on what you are doing and work at a speed which forces your brain to really 'superconcentrate' you will work both faster *and* more accurately. If you concentrate totally on what you are doing and screen out distractions you can typically work about 7% faster whilst also increasing accuracy.

The delegates who attend our *Developing an Eye for Accuracy* in-house training course are timed when they complete exercises. We measure how fast and how accurately they complete a task. And we enable delegates to experience the optimum speed for accuracy for themselves by doing a variety of fun and thought-provoking timed exercises.

Developing an Eye for Accuracy is the unique data accuracy skills training course which is proven to reduce error rates by 50% and increase processing speed by 7%. It saves money, boosts productivity and motivates people to take a pride in getting it right first time, every time.
